

**The Annual Testing of Fire-Safety Technologies (the Electronic Fire System, the Fixed Fire Extinguisher, the Fixed Gas Fire Extinguisher, the Voice Evacuation System) in Buildings A (CL, CR, NE and SE Wings) and B.**

On **April 9, 2016 from 8 a.m. until 8 p.m.**, regular annual testing and inspection of fire-safety technologies will be carried out in Buildings A (CL, CR, NE and SE wings) and B.

An integral, essential part of these tests will be the disconnection of the operational HVAC system, of the voice evacuation system, the testing of the fire ventilation of protected escape routes, the blocking of elevators and the closing of fire dampers.

Considering the fact that these tests entail a realistic risk of unpredictable disconnection from a power supply, we ask all the users of Buildings A and B for that period to adjust their work to this exceptional situation, to secure their workplaces and appliances that might be damaged by their turning off and on again should there be a power interruption and to limit their work in laboratory hoods.
